Questi	Question & Topic	Detailed Analytical Answer
Q1	Highest economic damage state?	Arunachal Pradesh (Rs. 88,724 Cr), driven by Public Utilities damage in 2018 (Rs. 86,096 Cr) from mountain road/bridge washouts.
Q2	Fatality pattern contrast between Bihar and Kerala?	Bihar had 768 deaths from prolonged river basin flooding (Kosi/Gandak); Kerala had 582 deaths from rapid landslides, reservoir release, and extreme cattle loss (48,009).
Q3	Why does Karnataka lead in flooded crop area (4.01 Mha) but rank lower in financial damage?	Dryland agriculture land value per hectare is lower than infrastructure destruction in industrialized or mountainous states.
Q4	Structural implications of West Bengal's housing damage?	West Bengal accounted for 43.3% of all damaged houses (850,422 units), showing high vulnerability of rural mud/kutcha dwellings to standing floodwaters.
Q5	Visualization rationale: Bar vs Pie?	Horizontal bar charts accommodate long state names and linear ranking without clutter; Pie charts represent part-to-whole proportions (Top 5 vs Others) summing to 100%.
Q6	Year-over-year escalation from 2016 to 2018?	Losses grew from Rs. 5,675 Cr (2016) to Rs. 26,396 Cr (2017) to Rs. 95,736 Cr (2018), driven by public utilities infrastructure vulnerability.
Q7	Data anomaly in Himachal Pradesh population affected?	Reported 68.65 Million in 2018 exceeds census population (~7.5M), reflecting cumulative person-days or repeated counting over multiple monsoon waves.
Q8	Cattle vs human mortality comparison?	106,664 cattle vs 5,288 humans (~20:1). Kerala had 45% of national cattle loss due to steep terrain and tethering during sudden flooding.
Q9	Predictive flood risk variables?	Crop Area Damaged (Mha), Damaged Houses to Population Ratio, and Public Utilities Damage Share.
Q10	Normalization techniques?	Casualties per 100k population, flooded crop area as % of Gross Cropped Area (GCA), and financial damage as % of SGDP.
